Algorithm 1: Main Routine for Gaussian Elimination Solver

Input: Input File Path (string), tol (long double), max_iter (int)

Output: Solutions (array)

```
1 while True do
2     selected_file ← SelectInputFile();           // Select the input file
3     if selected_file is empty then
4         exit ;                                   // Exit if no file is selected
5     end
6     start_time ← StartTimer();                   // Start the timer
7     InitMatrix(matrix, selected_file, rows, cols); // Initialize the matrix
8     ShowEquations(matrix, rows, cols);           // Display the system of equations
9     exchange_count ← GaussianElimination(matrix, rows, cols); // Perform Gaussian elimination
10    rank ← DetermineRank(matrix, rows, cols);     // Determine the rank of the matrix
11    consistent ← CheckConsistency(matrix, rows, cols); // Check if the system is consistent
12    if not consistent then
13        DisplaySolution("No solution");          // Display no solution message
14    end
15    else if rank < (cols - 1) then
16        ShowGeneralSolution(matrix, rows, cols, rank); // Display parameterized solution
17    end
18    else
19        solution ← BackSubstitution(matrix, rows, cols, solution); // Perform back substitution
20        if solvable then
21            DisplaySolution(solution);            // Display the unique solution
22        end
23        else
24            DisplaySolution("No solution");        // Display no solution if back substitution fails
25        end
26    end
27    StopTimer(start_time);                         // Stop the timer
28    choice ← AskRunAgain();                         // Ask if the user wants to run again
29    if choice ≠ 'y' and choice ≠ 'Y' then
30        break ;                                   // Exit loop if the choice is not 'y' or 'Y'
31    end
32 end
33 WaitForExit();                                   // Wait for program exit
```

Algorithm 2: Pivoting to Select the Maximum Element in a Column

Input: *matrix* (Matrix), *current_row* (int), *total_rows* (int)

Output: *imax* (int)

```
1 imax  $\leftarrow$  current_row;  
2 max_val  $\leftarrow$  |matrix[current_row][current_row]|;  
3 for i  $\leftarrow$  current_row + 1 to total_rows - 1 do  
4   | val  $\leftarrow$  |matrix[i][current_row]|;  
5   | if val > max_val then  
6   |   | imax  $\leftarrow$  i;  
7   |   | max_val  $\leftarrow$  val;  
8   | end  
9 end  
10 return imax;
```
